

## **Abstract**

An adverse weather headlamp assembly that comprises a foreground shield with two sides that taper up from a bottom portion to form a triangular shaped shield. The foreground shield can be movable between a blocking position and a pass-through position. In combination with a cutoff shield, the foreground shield reduces the amount of emitted light that can be reflected off of a wet or icy road in adverse weather conditions in order to reduce glare, while still allowing enough light to be emitted for the driver to adequately see the road.
